## 2024\_28\_III\_OOPS Using Java Lab

### **REC\_2028\_OOPS using Java\_Week 8\_CY**

Attempt : 1  
Total Mark : 40  
Marks Obtained : 40

#### **Section 1 : Coding**

##### **1. Problem Statement**

A company is developing a user registration system that requires users to provide valid email addresses. The development team is implementing an EmailValidator program to ensure that the entered email addresses meet certain criteria using exception handling.

The email address must contain the "@" symbol. The email address must consist of a non-empty username(before "@" symbol) and a non-empty domain(after "@" symbol). The domain part of the email address must contain at least one period ("."). The email address must not contain leading or trailing spaces.

Implement a custom exception, InvalidEmailException, to fulfill the company's requirements and validate it according to the specified rules.

### ***Input Format***

The input consists of a string value 's', which represents the email address.

### ***Output Format***

The output is displayed in the following format:

If the entered email address is valid according to the specified rules, the program prints:

"Email address is valid!"

If the entered email address misses the username or domain part or misses "@" symbol or has two or more "@" symbols or misses '.' in the domain part it outputs:

"Error: Invalid email format."

Refer to the sample output for formatting specifications.

### ***Sample Test Case***

Input: johndoe@example.com

Output: Email address is valid!

### ***Answer***

```
import java.util.Scanner;
class InvalidEmailException extends Exception{
    public InvalidEmailException(String s){
        super(s);
    }
}
class main{
    public static void check(String s) throws InvalidEmailException{

        if(!s.endsWith(".com") || !s.contains("@")){
            throw new InvalidEmailException("Invalid email format.");
        }
        String[] p=s.split("@");
        if(p.length!=2 || p[0].isEmpty()||p[1].isEmpty()){

        }
    }
}
```

```
        throw new InvalidEmailException("Invalid email format.");
    }
    System.out.print("Email address is valid!");
}
public static void main(String[] args){
    Scanner sc=new Scanner(System.in);
    String s=sc.nextLine();
    try{
        check(s);
    }
    catch(InvalidEmailException e){
        System.out.print("Error: "+e.getMessage());
    }
}
```

**Status :** Correct

**Marks :** 10/10

## 2. Problem Statement

Camila, a user of a social media platform, is looking to change her password to enhance account security. The platform enforces specific rules for password strength to ensure the safety of user accounts. Camila needs a program that prompts her to enter a new password and throws custom exceptions based on the strength of the password.

Password Strength Criteria:

Weak Password:

Length less than 8 characters. Medium Password:

Length 8 or more characters. Missing a mix of uppercase letters, lowercase letters, and digits.

Implement a custom exception, to assist Camila in changing her password securely. The program should interactively take user input for a new password, categorize its strength, and handle custom exceptions (WeakPasswordException and MediumPasswordException) if the password fails to meet the specified criteria.

### ***Input Format***

The input consists of a string s, representing the new password.

### ***Output Format***

The output is displayed in the following format:

If the entered password meets the strength criteria, the program outputs

"Password changed successfully!"

If the entered password is weak, the program outputs

"Error: Weak password. It must be at least 8 characters long."

If the entered password is of medium strength, the program outputs

"Error: Medium password. It must include a mix of uppercase letters, lowercase letters, and digits."

Refer to the sample output for formatting specifications.

### ***Sample Test Case***

Input: ComplexP@ss1

Output: Password changed successfully!

### ***Answer***

```
import java.util.Scanner;
class WeakPasswordException extends Exception{
    public WeakPasswordException(String s){
        super(s);
    }
}
class MediumPasswordException extends Exception{
    public MediumPasswordException(String s){
        super(s);
    }
}
class main{
```

```
public static void check(String s) throws
MediumPasswordException,WeakPasswordException{
    int l1=s.length();
    if(l1<8){
        throw new WeakPasswordException("It must be at least 8 characters
long.");
    }
    else{
        int u=0,l=0,l2=0,d=0;
        for(int i=0;i<l1;i++){
            if(Character.isDigit(s.charAt(i))){
                d++;
            }
            if(Character.isLetter(s.charAt(i))){
                l2++;
            }
            if(Character.isLowerCase(s.charAt(i))){
                l++;
            }
            if(Character.isUpperCase(s.charAt(i))){
                u++;
            }
        }
        if(u==0 || l==0 || l2==0 || d==0){
            throw new MediumPasswordException("It must include a mix of
uppercase letters, lowercase letters, and digits.");
        }
        System.out.print("Password changed successfully!");
    }
}
public static void main(String[] args){
    Scanner sc=new Scanner(System.in);
    String s=sc.nextLine();
    try{
        check(s);
    }
    catch(MediumPasswordException e){
        System.out.print("Error: Medium password. "+e.getMessage());
    }
    catch(WeakPasswordException e){
        System.out.print("Error: Weak password. "+e.getMessage());
    }
}
```

```
}
```

Status : Correct

Marks : 10/10

### 3. Problem Statement

Theo is trying to update his payment information on a subscription-based streaming service. To proceed, the system requires Theo to provide a valid credit card number consisting of 16 digits. However, Theo wants to make sure that the credit card number he enters meets the specified criteria with proper exception handling.

The credit card number must consist of exactly 16 digits. If the entered credit card number does not meet the specified criteria, the program should throw a custom exception, `InvalidCreditCardException`, and provide Theo with specific error messages: If the length of the credit card number is not 16 digits, the exception message should be: "Invalid credit card number length." If the credit card number contains non-numeric characters, the exception message should be: "Invalid credit card number format."

Implement a custom exception, `InvalidCreditCardException`, to fulfill Theo's requirements and keep his payment information secure.

#### *Input Format*

The input consists of a string value 's', consisting of the 16-digit credit card number.

#### *Output Format*

The output is displayed in the following format:

If the entered credit card number is valid, the program should output a success message:

"Payment information updated successfully!"

If the entered credit card has more than 16 digits or less than 16 digits it displays

"Error: Invalid credit card number length."

If the entered 16-digit credit card has non-integers it displays  
"Error: Invalid credit card number format."

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: 1234567890123456

Output: Payment information updated successfully!

### **Answer**

```
import java.util.Scanner;
class InvalidCreditCardException extends Exception{
    public InvalidCreditCardException(String s){
        super(s);
    }
}
class main{
    public static void check(String s) throws InvalidCreditCardException{
        int l=s.length();
        if(l!=16){
            throw new InvalidCreditCardException("length.");
        }
        else{
            for(int i=0;i<l;i++){
                if(!Character.isDigit(s.charAt(i))){
                    throw new InvalidCreditCardException("format.");
                }
            }
        }
        System.out.print("Payment information updated successfully!");
    }
    public static void main(String[] args){
        Scanner sc=new Scanner(System.in);
        String s=sc.nextLine();
        try{
            check(s);
        }
```

```
        catch(InvalidCreditCardException e){
            System.out.print("Error: Invalid credit card number "+e.getMessage());
        }
    }
}
```

**Status : Correct**

**Marks : 10/10**

#### 4. Problem Statement

In an online shopping cart system, users can apply coupon codes during checkout to avail of discounts. However, to ensure the validity and security of coupon codes, the system enforces specific rules for their format. Your task is to implement a Java program named CouponCodeValidator that takes user input for a coupon code and validates it according to the specified rules.

**Rules for Valid Coupon Code:**

The coupon code must consist of exactly 10 characters. The coupon code must contain at least one alphabet (uppercase or lowercase) and at least one digit (0-9). Special characters are not allowed in the coupon code.

Implement a custom exception, InvalidCouponException, to handle cases where the entered coupon code does not meet the specified criteria.

#### ***Input Format***

The input consists of a string s, representing the coupon code.

#### ***Output Format***

The output is displayed in the following format:

If the entered coupon code meets the specified criteria, the program outputs "Coupon code applied successfully!"

If the entered coupon code has less than or more than 10 characters it outputs "Error: Invalid coupon code length. It must be exactly 10 characters."

If the entered coupon code contains only numeric or only alphabets it outputs  
"Error: Invalid coupon code format. It must contain at least one alphabet and one digit."

If the entered coupon code contains special characters it outputs  
"Error: Coupon code should not contain special characters."

Refer to the sample output for formatting specifications.

#### **Sample Test Case**

Input: ABCD123456

Output: Coupon code applied successfully!

#### **Answer**

```
import java.util.Scanner;
class InvalidCouponException extends Exception{
    public InvalidCouponException(String s){
        super(s);
    }
}
class main{
    public static void check(String s) throws InvalidCouponException{
        int l=s.length();
        if(l!=10){
            throw new InvalidCouponException("Invalid coupon code length. It must
be exactly 10 characters.");
        }
        else{
            int c=0,p=0;
            for(int i=0;i<l;i++){
                if(!Character.isLetterOrDigit(s.charAt(i))){
                    throw new InvalidCouponException("Coupon code should not contain
special characters.");
                }
                if(!Character.isLetter(s.charAt(i))){
                    c++;
                }
            }
        }
    }
}
```

```
        else if(!Character.isDigit(s.charAt(i))){  
            p++;  
        }  
    }  
    if(c==10 || p==10){  
        throw new InvalidCouponException("Invalid coupon code format. It  
must contain at least one alphabet and one digit.");  
    }  
}  
System.out.print("Coupon code applied successfully!");  
}  
public static void main(String[] args){  
    Scanner sc=new Scanner(System.in);  
    String s=sc.nextLine();  
    try{  
        check(s);  
    }  
    catch(InvalidCouponException e){  
        System.out.print("Error: "+e.getMessage());  
    }  
}
```
