## 2024\_28\_III\_OOPS Using Java Lab

### **REC\_Week 12\_Java\_Lambda Expressions\_PAH**

Attempt : 1  
Total Mark : 40  
Marks Obtained : 40

#### **Section 1 : COD**

##### **1. Problem Statement**

Emily, an analyst at a data processing firm, is tasked with cleaning up datasets to remove duplicate values from lists of integers.

Create a Java program that allows Emily to input a series of integers, with the program then utilizing a lambda expression to efficiently remove any duplicates.

##### ***Input Format***

The first line of input consists of an integer N, representing the size of the array.

The second line consists of N space-separated integers, each denoting an array element.

##### ***Output Format***

The output prints the array elements after removing the duplicates inside the square bracket separated by a comma and space.

Refer to the sample output for formatting specifications.

### ***Sample Test Case***

Input: 15  
1 2 3 4 3 2 1 2 3 4 4 4 5 5 6

Output: [1, 2, 3, 4, 5, 6]

### ***Answer***

```
import java.util.*;
interface Iam{
    int[] func(int[] arr);
}
class p{
    public static void main(String[] args){
        Scanner sc = new Scanner(System.in);
        int n=sc.nextInt();
        int[] arr= new int[n];
        for(int i=0;i<n;i++){
            arr[i]=sc.nextInt();
        }
        Iam bold=(arr1)->{
            int[] arr2= new int[arr1.length];
            int l=0;
            for(int i=0;i<n;i++){
                boolean found=false;
                for(int j=0;j<l;j++){
                    if(arr1[i]==arr2[j]){
                        found=true;
                        break;
                    }
                }
                if(!found){
                    arr2[l++]=arr1[i];
                }
            }
            return Arrays.copyOf(arr2,l);
        }
    }
}
```

```
        };
        System.out.print(Arrays.toString(bold.func(arr)));
    }
}
```

**Status :** Correct

**Marks :** 10/10

## 2. Problem Statement

Sneha is developing a feature for an e-commerce application that helps display product details after applying a seasonal discount.

She decides to use lambda expressions with the Consumer functional interface to print each product's name, original price, and discounted price neatly.

The program should:

Accept a list of product names and their prices. Apply a 15% discount on all products. Use a Consumer lambda expression to display the details in a formatted manner.

### ***Input Format***

The first line of input consists of an integer n, representing the number of products.

The next n lines each contain a String (product name) and a double (price) separated by a space.

### ***Output Format***

For each product, print the details in the format:

Product: <name>, Original Price: <price>, Discounted Price: <discounted price>

If there are no products, print:

No products available

### ***Sample Test Case***

Input: 1

Phone 60000

Output: Product: Phone, Original Price: 60000.0, Discounted Price: 51000.0

### Answer

```
import java.util.*;
interface product{
    String cal(String s,int a);
}
class p{
    public static void main(String[] args){
        Scanner sc = new Scanner(System.in);
        int n=sc.nextInt();
        if(n==0){
            System.out.print("No products available");
            return;
        }
        product discount=(s,a)->{
            String c="Product: "+s+", Original Price: ";
            double d=(double) a;
            c+=String.format("%.1f",d);
            c+=", Discounted Price: ";
            double e=d-(d*0.15);
            c+=String.format("%.1f",e);
            return c;
        };
        for(int i=0;i<n;i++){
            String s1=sc.next();
            int r=sc.nextInt();
            System.out.println(discount.cal(s1,r));
        }
    }
}
```

Status : Correct

Marks : 10/10

### 3. Problem Statement

Aditya is developing a reading app that recommends books to users based on a predefined list.

Each time a user opens the app, it should supply the next book title in the list, one at a time, using a lambda expression and the Supplier functional interface.

When all books have been recommended, the list should start again from the beginning.

#### ***Input Format***

The first line contains an integer n – the total number of available book titles.

The next n lines each contain a book title (a string).

The next line contains an integer m – the number of times users open the app (i.e., the number of recommendations to be made).

#### ***Output Format***

Print the supplied book title for each recommendation, one per line.

If m > n, repeat the list from the start.

#### ***Sample Test Case***

Input: 3

The Alchemist

Atomic Habits

Ikigai

5

Output: The Alchemist

Atomic Habits

Ikigai

The Alchemist

Atomic Habits

#### ***Answer***

```
import java.util.*;
import java.util.function.Supplier;
class p{
    public static void main(String[] args){
        Scanner sc = new Scanner(System.in);
        int n=sc.nextInt();
        sc.nextLine();
        String[] books=new String[n];
```

```
for(int i=0;i<n;i++){
    books[i]=sc.nextLine();
}
int m=sc.nextInt();
final int[] index={0};
Supplier<String> nextBook=()->{
    String book=books[index[0]];
    index[0]=(index[0]+1)%n;
    return book;
};
for(int i=0;i<m;i++){
    System.out.println(nextBook.get());
}
}
```

**Status :** Correct

**Marks :** 10/10

#### 4. Problem Statement

Rishi is working as an HR analyst in a software company. He wants to filter a list of employees based on their salary using modern Java techniques. He has a list of employee names and salaries and wants to use lambda expressions to filter those who earn more than a specific threshold.

Implement a program using lambda expressions and functional interfaces to print the names of employees whose salary is greater than or equal to 50,000.

##### ***Input Format***

The first line of input consists of an integer n, representing the number of employees.

The next n lines. Each line contains a String (employee name) and an int (salary).

##### ***Output Format***

The output prints the names of employees whose salary is greater than or equal to 50000, each on a new line.

If no employee found with salary greater than 50000, print: No employee found

with salary >= 50000

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: 4  
Amit 45000  
Sneha 50000  
Ravi 60000  
Priya 30000  
Output: Sneha  
Ravi

### **Answer**

```
import java.util.*;  
interface lam{  
    void cal(String s);  
}  
class p{  
    public static void main(String[] args){  
        Scanner sc = new Scanner(System.in);  
        int n=sc.nextInt();  
        sc.nextLine();  
        lam find=(String s)->{  
            System.out.println(s);  
        };  
        int c=0;  
        for(int i=0;i<n;i++){  
            String s=sc.next();  
            int a=sc.nextInt();  
            if(a>=50000){  
                find.cal(s);  
            }  
            else{  
                c++;  
            }  
        }  
        if(c==n){
```

```
        } } System.out.print("No employee found with salary >=50000");  
    } }
```
